PROCEEDINGS OF THE CLUB.

8th December, 1899. The 210th meeting was held at 156 Brattle St., Mr. W. L. W. Field in the chair.

Mr. R. Hayward remarked at some length on the results of a recent study of the North American species of Tachys, which will form the subject of a paper soon to be published in the Transactions of the American Entomological Society. Figures were shown illustrating the more important characters.

Mr. S. H. Scudder read extracts from a letter of Mrs. A. T. Slosson mentioning her discovery of *Gryllus luctuosus* on or near the summit of Mt. Washington, N. H.

He also showed specimens of the dark form of the mature larva of *Papilio polyacues* recently described in Psyche by Miss C. G. Soule, remarking that it was virtually an extension of the coloring of the fourth stage into the fifth, and by the closure of the yellow spots on the dark ground (normally open in front) recalled strikingly the markings of the European species, *P. machaon*, also exhibited.

He further called the attention of the Club to the striking differences between the Orthopteran fauna of Europe and the United States. Of our 205 recognized genera, only 26 occurred in Europe, and half of these were cosmopolitan.

Scudder's Brief Guide to the Commoner Butterflies.

By Samuel II. Scudder. xi + 206 pp. 12mo. \$1.25.

An introduction, for the young student, to the names and something of the relationship and lives of our commoner butterflies. The author has selected for treatment the butterflies, less than one hundred in number, which would be almost surely met with by an industrious collector in a course of a year's or two year's work in our Northern States east of the Great Plains, and in Canada. While all the apparatus necessary to identify these butterflies, in their earlier as well as perfect stage, is supplied, it is far from the author's purpose to treat them as if they were so many mere postage-stamps to be classified and arranged in a cabinet. He has accordingly added to the descriptions of the different species, their most obvious stages, some of the curious facts concerning their periodicity and their babits of life.

Scudder's The Life of a Butterfly. A Chapter in Natural History for the General Reader.

By SAMUEL II. SCUDDER. 186 pp. 16mo. \$1.00.

In this book the author has tried to present in untechnical language the story of the life of one of our most conspicuous American butterflies. At the same time, by introducing into the account of its anatomy, development, distribution, enemies, and seasonal changes some comparisons with the more or less dissimilar structure and life of other butterflies, and particularly of our native forms, he has endeavored to give, in some fashion and in brief space, a general account of the lives of the whole tribe. By using a single butterfly as a special text, one may discourse at pleasure of many; and in the limited field which our native butterflies cover, this method has a certain advantage from its simplicity and directness.

Guide to the Genera and Classification of the Orthoptera of North America north of Mexico. By Samuel H. Scudder. 90 pp. 8°.

Contains keys for the determination of the higher groups as well as the (nearly 200) genera of our Orthoptera, with full bibliographical aids to further study. Sent by mail on receipt of price (\$1.00).
